RESORT IN BAHRAIN

The urban study

Including a variable type of house known as [The Concept House for the Gulf](#), which could be built on different types of terrain. It also allows creation of different urban formations.

The Concept House for the Gulf is inspired by the Arabic architecture and especially the historic structure of local towns and settlements.

The design envisions a contemporary, timeless residence that will become an oasis of peace and unforgettable memories for a four to seven-member family.

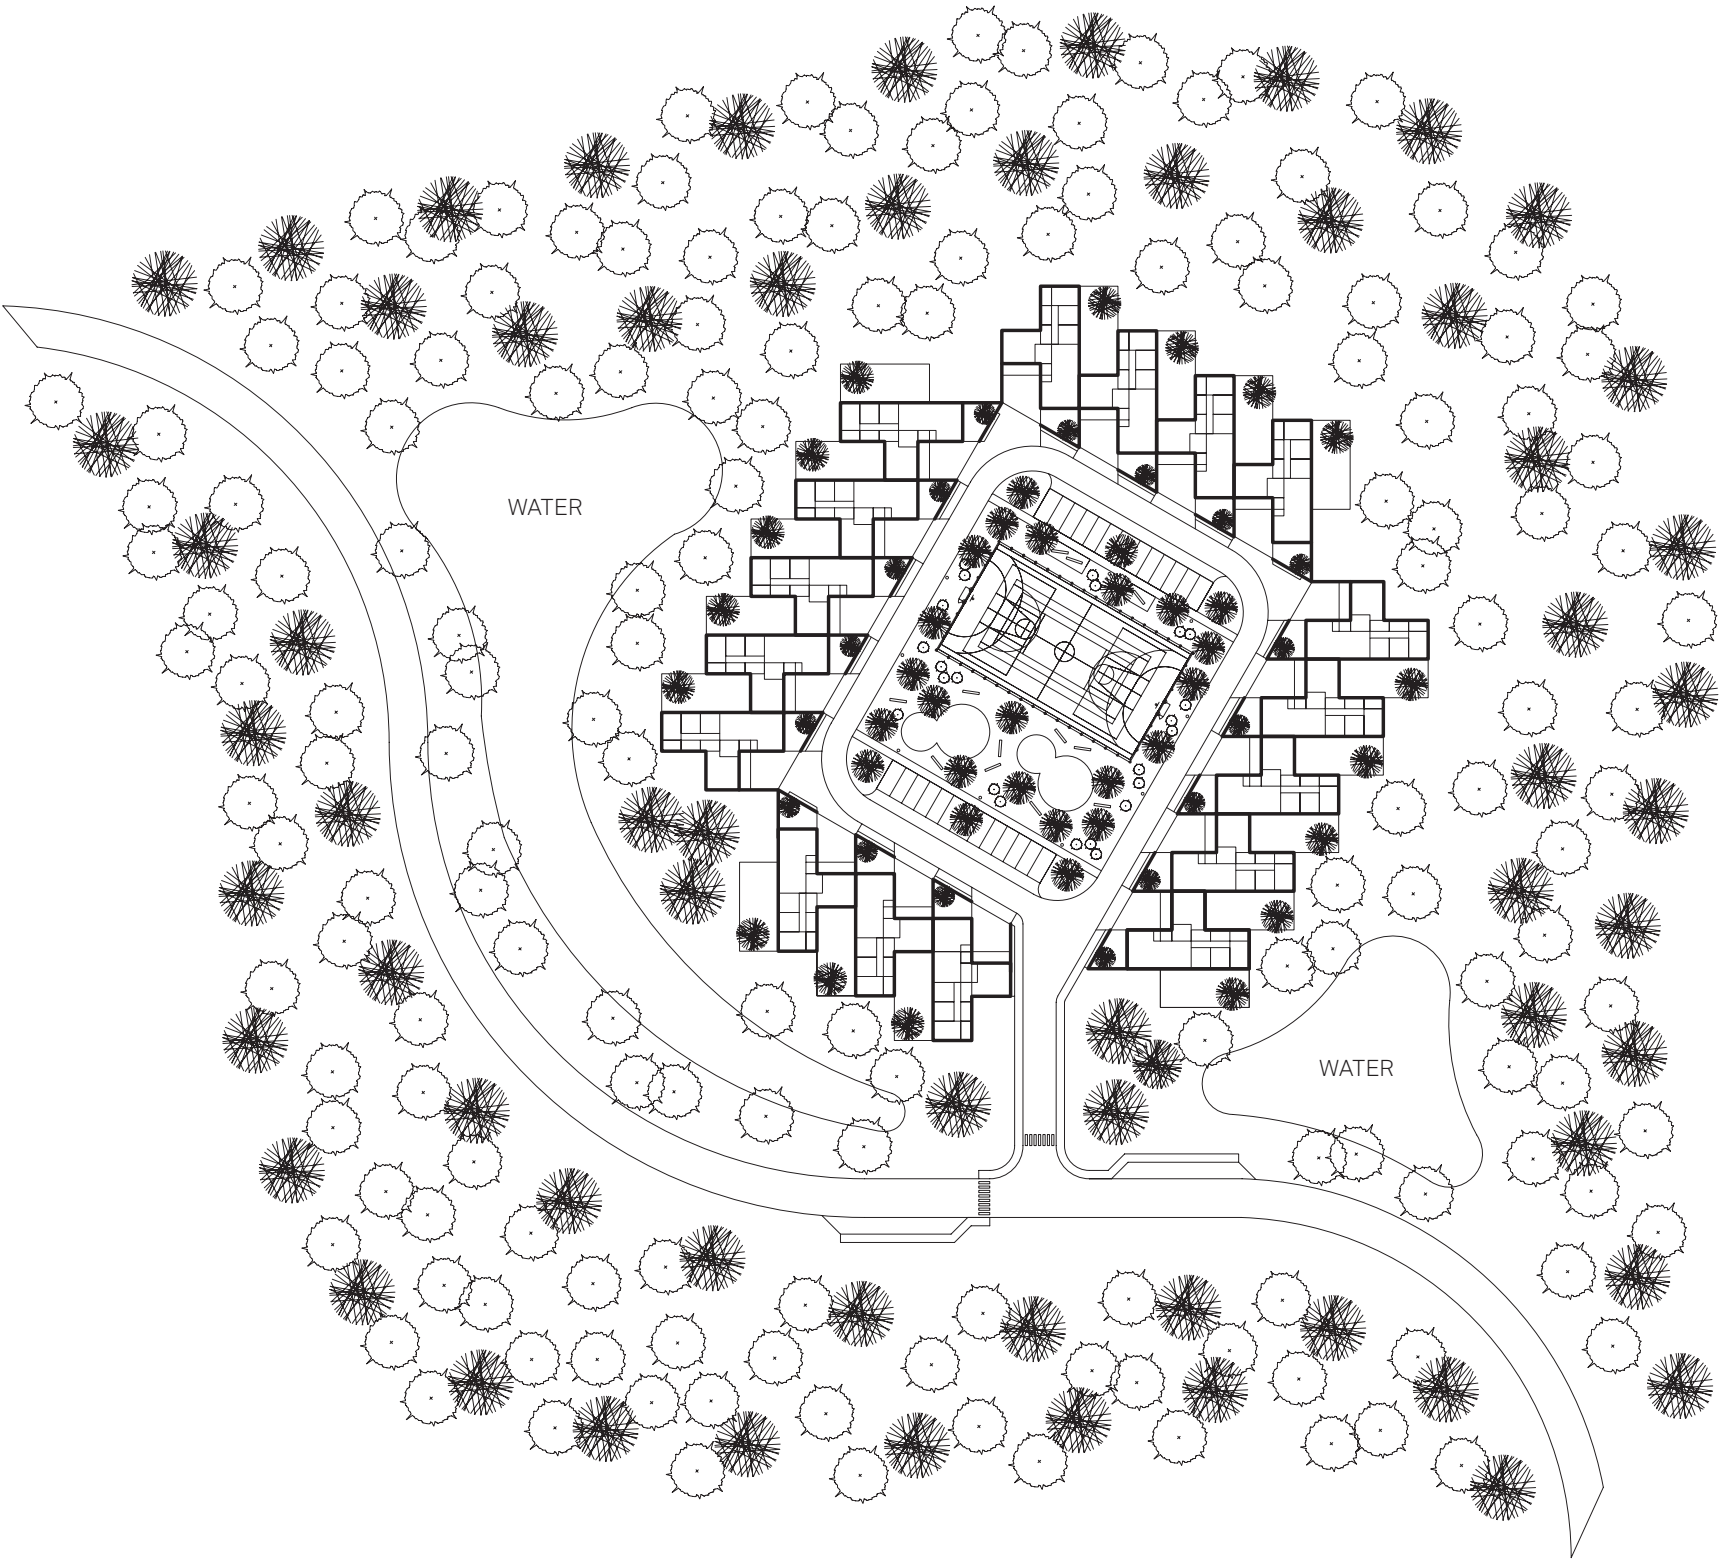

A single-story atrium house is optimized for locations with extreme sunlight.

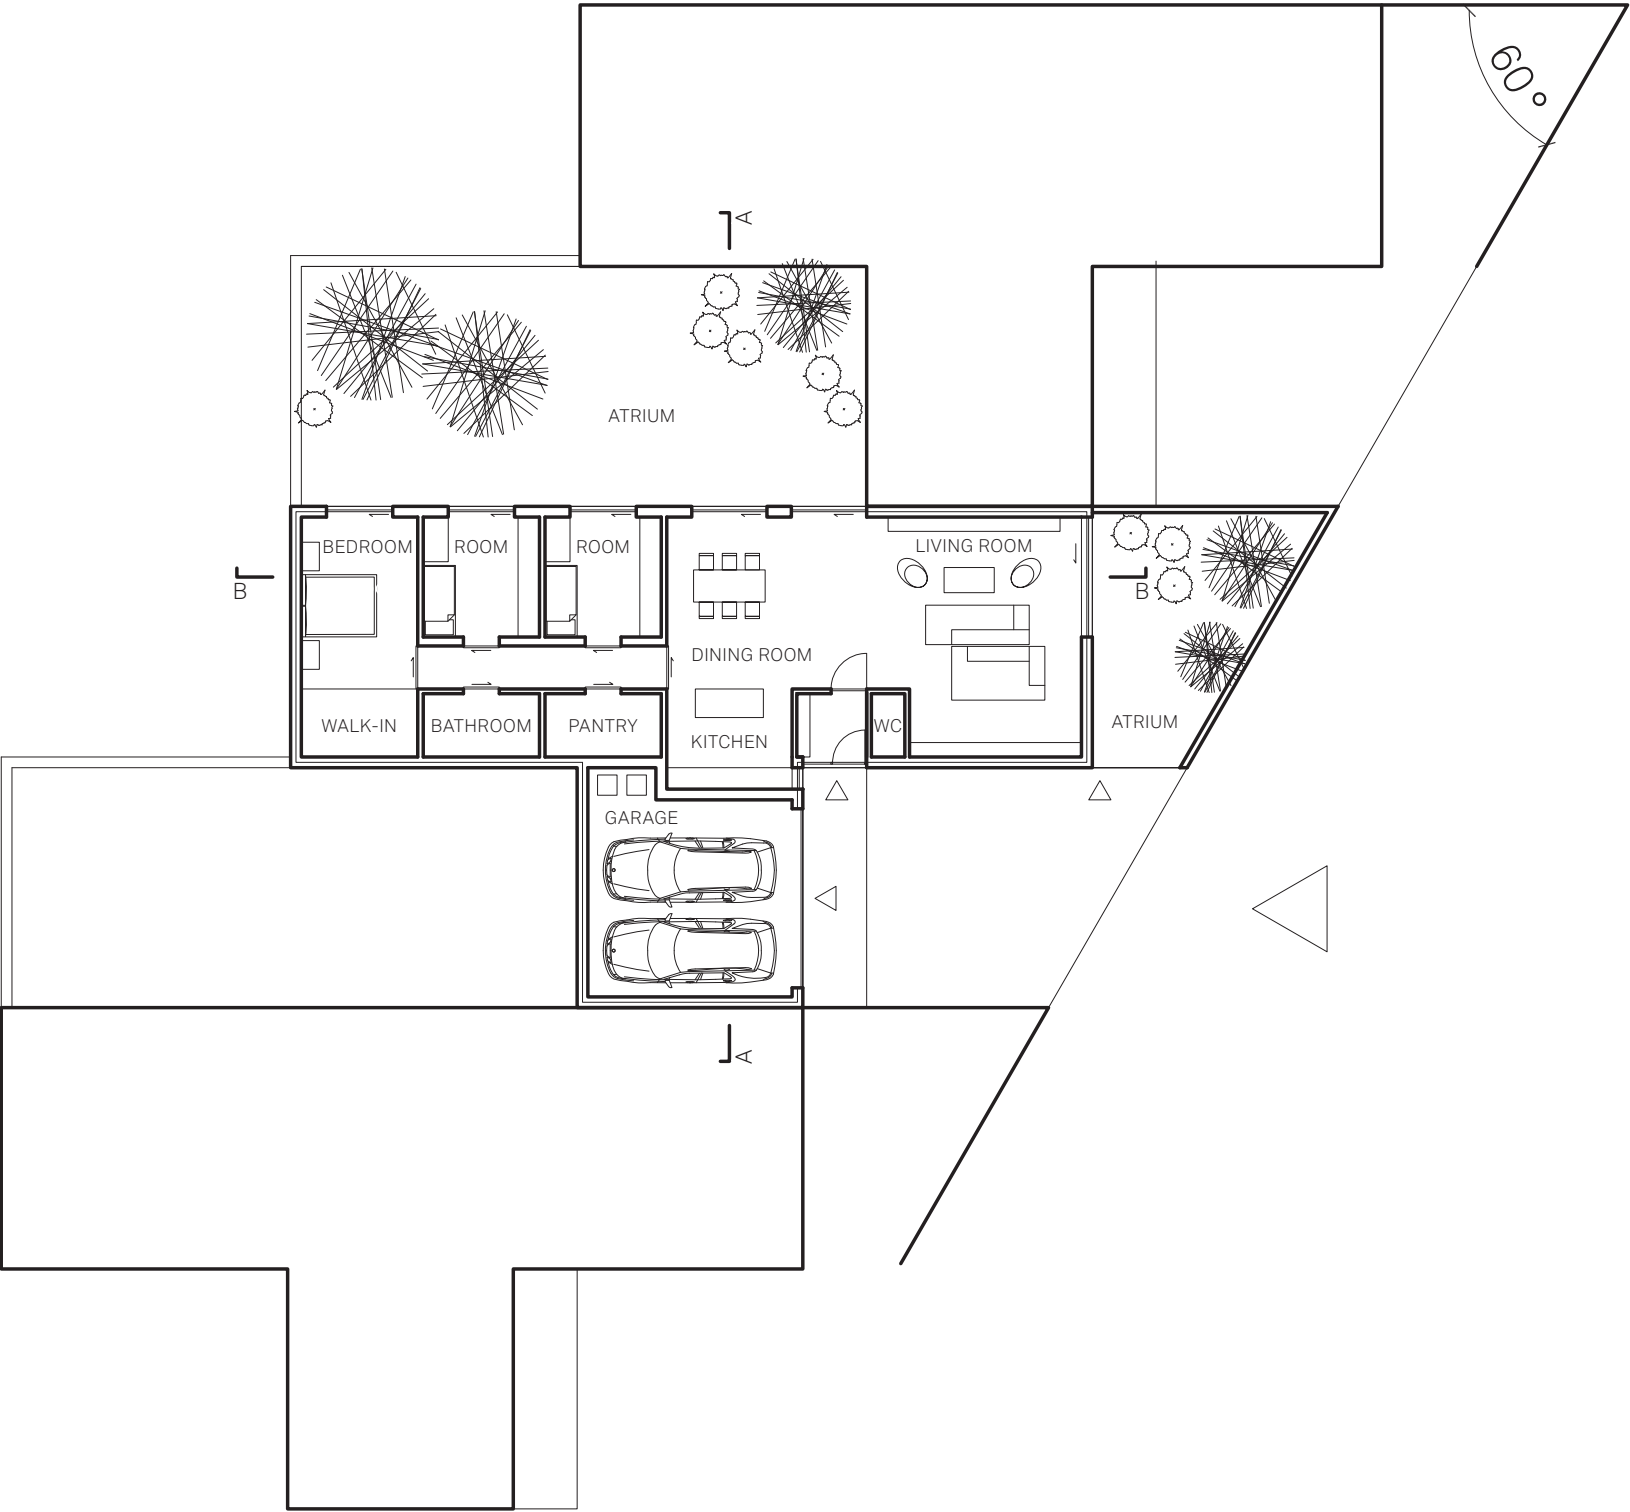

The house is built with unique pre-cast concrete panels with built-in electrical, water and drainage ducts.

A flat roof enables easy and straightforward installation of photovoltaic panels.

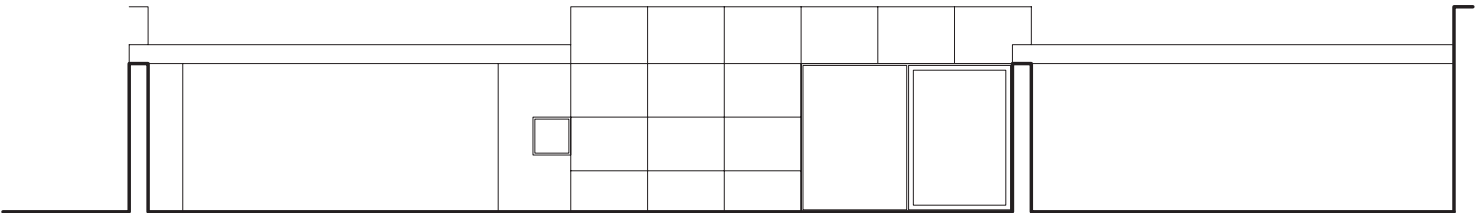

Houses can be assembled in standalone rows or tight multi-row formations, creating pleasant and ample shade.

Easy implementation of water elements, playgrounds, parking lots or waste-management points further enhances attractiveness of these houses for urban environment.
